

**Bharati Vidyapeeth (Deemed to be
University), Centre for Distance and
Online Education, Pune School of
Online Education**

Minor Project-1 Report

On

“Online Event Management System”

**Submitted in Partial Fulfilment of the Requirements for
the Award of Degree of
Master of Computer Applications (Online
Mode) 2025 – 2026**

Submitted by

Sujit Dilip Suryawanshi

(PRN No - 2545101034)

Guided By

Ms. Pratima Gund

Declaration

The project report entitled **“Online Event Management System”** Submitted to Bharati Vidyapeeth (Deemed to be University), Centre for Distance and Online Education, School of Online Education Pune in partial fulfilment of the requirement for the award of the degree of MCA (Online Mode) is an original work carried out under the guidance of **Ms. Pratima Gund**. The matter embodied in this project is a genuine work done by me to the best of my knowledge and belief and has not been submitted before, neither to this University nor to any other University for the fulfilment of the requirement of any course of study.

Signature

Sujit Dilip Suryawanshi

PRN No - 2545101034

Acknowledgement

Apart from my efforts, the success of my project depends largely on the encouragement and guideline of many others. I take this opportunity to express my gratitude to the people who have been instrumental in the successful completion of this project.

I am gratefully indebted to our esteemed guide **Ms. Pratima Gund** for his sincere guidance and priceless support which would have been impossible for us to complete this project.

Finally, I thank Centre for Distance and Online Education, Pune (CDOE) School of Online Education (SOE) for giving me this golden opportunity to do my minor project.

Online Event Management

Online Event Management System - Technology & Tools Documentation

Project Name: Online Event Management System

- **Website URL:** <http://localhost/event-management>
- **PhpMyAdmin:** <http://localhost/phpmyadmin>
- **Admin Login:**
Username: admin
Password: admin123

1. Project Overview:

The Event Management System is a web-based application developed for managing event bookings, payments, customer interactions, feedback, and administrative operations. The system provides separate interfaces for customers and administrators.

2. Technologies Used:

→ Frontend Technologies:

- HTML5
- CSS3
- Bootstrap 5.3
- JavaScript

→ Backend Technology:

- PHP

→ Database Technology:

- MySQL

3. Development/ Software Tools Used:

Tool	Purpose
Visual Studio Code (VS Code)	Source Code Development
XAMPP	Local Development Environment
Apache Server	Web Server
phpMyAdmin	Database Management
MySQL	Data Storage and Management
Bootstrap	Responsive User Interface Design
O/S	Windows 10/11
Platform	Google Chrome

4. Hardware Requirements

- Intel i3/i5/i7 Processor
- 4GB RAM Minimum
- 500GB Storage
- Internet Connection

5. Database Details

→Database Name: event_management

Main Tables:

- admin_users
- client
- booking
- payment
- event
- vendor
- staff

6. Project Modules

- Home Page
- Services Module
- Gallery Module
- Feedback Module
- Booking Module
- Payment Module
- Payment Slip Module
- Customer Registration & Login
- Customer Dashboard
- Admin Login & Dashboard
- Manage Bookings
- Manage Events
- Manage Vendors
- Manage Feedback

7. Security Features

- Session-Based Authentication
- Admin Access Control
- Customer Login Validation
- Protected Dashboard Access
- Logout Functionality

8. Project Outcome

The Event Management System successfully automates event booking, payment processing, customer management, and administrative operations through a user-friendly web interface.

ASSIGNMENT NO - 1

❖ Preliminary Investigation and its activities.

1. Problem Identification

Event management is an important service in today's society where birthdays, weddings, anniversaries, corporate functions, and many other social or professional programs are frequently organized. Traditionally, people depend on manual processes for planning and managing such events. This involves physically contacting decorators, caterers, musicians, photographers, and other service providers, which takes a lot of time and effort. Miscommunication between customers and service providers often leads to mistakes such as incorrect booking dates, missing services, or budget overruns.

From the manager's side, handling multiple events at the same time is challenging. Maintaining customer details, staff schedules, payments, and service arrangements manually on paper or in separate files can cause data loss, duplication, and inefficiency. Customers may not get clear information about available services, package costs, or the status of their booking. Similarly, managers cannot easily track pending payments or evaluate staff assignments.

As the number of events increases, these manual processes become more complicated and error-prone. This results in poor customer satisfaction and loss of business opportunities. Therefore, there is a strong need for an automated solution that can handle all aspects of event planning and execution in one system.

2. Problem Definition

The proposed problem is the absence of a centralized and automated Event Management System that can provide a complete solution for organizing and managing events such as birthdays, weddings, and corporate programs. The system should allow customers to easily register and book their events by selecting the type of program and required services such as catering, decoration, music, and photography. It should enable event managers to maintain proper records of customers, events, staff, services, and payments in

a single database. The system must also provide functionalities for staff assignment, payment tracking, and report generation.

By developing such a system, the difficulties of manual work, communication gaps, and scheduling conflicts can be reduced. The solution will improve efficiency, save time, minimize errors, and ensure better coordination between customers and event managers. Ultimately, the computerized event management system will provide a reliable, user-friendly platform that enhances customer satisfaction and supports smooth execution of events.

3. Problem Description

In today's modern world, events such as birthdays, weddings, corporate functions, cultural programs, and social gatherings have become an essential part of life. Organizing these events successfully requires proper planning, coordination, and execution of multiple activities such as booking venues, arranging catering, hiring decorators, managing music and photography, and ensuring smooth staff involvement. Traditionally, all these tasks are carried out manually by the event organizer or by the customer themselves. This manual process is time-consuming, inefficient, and often leads to errors.

One of the major issues with manual event management is the lack of centralized information. Customers need to contact multiple service providers individually, which makes comparison and decision-making difficult. Similarly, event managers need to handle a large amount of data related to customers, services, staff, and payments, often maintained in registers, spreadsheets, or personal notes. As the number of events and clients increases, maintaining accuracy and reliability becomes a challenge.

Miscommunication, double bookings, scheduling conflicts, and incomplete services are common outcomes of such manual processes. For example, if a customer books an event and requests catering and photography, the manager needs to contact separate service providers and confirm availability. If any detail is misplaced or forgotten, it can lead to customer dissatisfaction and damage the reputation of the event management business. Furthermore, tracking payments and balances manually creates financial risks. There is

also no quick way to generate reports, analyze costs, or keep a proper record of past events for future reference.

Another problem arises in staff management. Assigning the right staff for multiple events happening on different dates requires careful scheduling. If handled manually, there is a high chance of conflicts or misallocation of staff. In addition, customers may want to know the status of their bookings, pending payments, or service confirmations, which cannot be easily provided without an automated system.

Thus, the lack of a proper computerized solution results in wasted time, poor coordination, and unsatisfied customers. The growing demand for professional and well-organized events highlights the need for a digital Event Management System. Such a system would integrate all event-related processes in a single platform, making it easier for customers to book events, for managers to plan and allocate resources, and for staff to perform their duties efficiently.

4. Fact Finding Techniques

Before developing any software system, it is essential to gather detailed information about the existing system, the problems faced by users, and the requirements of the new system. This process is known as **fact finding**. It helps the developer understand what the users actually need, what problems exist in the current process, and what features should be included in the proposed system.

For the **Event Management System (Birthday, Wedding, etc.)**, fact finding is very important because event organization involves multiple stakeholders such as customers, event managers, service providers (caterers, decorators, photographers, etc.), and staff. Each of these groups has different requirements, and their inputs must be collected to design an effective system.

The commonly used **fact-finding techniques** in this project are:

1) Interviews

Interviews are one of the most effective techniques to gather first-hand information. Direct communication with customers, event organizers, and service providers was carried out to understand their needs, expectations, and difficulties with the current manual system. Questions were asked about how events are booked, how services are arranged, how payments are tracked, and what problems occur during coordination. These interviews provided clear insights into the practical challenges of event management.

2) Questionnaires

Questionnaires were prepared and distributed among customers and event managers to collect information from a larger group of people in less time. The questionnaires contained both open-ended and close-ended questions related to services, booking processes, budget management, and customer satisfaction. This method helped in identifying common issues faced by users and their preferences regarding the features of the new system.

3) Observation

The existing manual process of event arrangement was observed in real scenarios. By watching how event managers interact with customers, book services, allocate staff, and manage payments, it was possible to identify inefficiencies and repeated problems. Observation helped in understanding the actual workflow, the sequence of activities, and areas where automation could save time and reduce errors.

4) Record and Document Analysis

Existing records such as booking registers, payment receipts, staff allocation sheets, and service agreements were studied to understand how information is currently maintained. This analysis revealed the difficulties of maintaining manual records, risks of data loss, and challenges in retrieving information when required.

5) Brainstorming and Discussions

Discussions with team members, staff, and supervisors were conducted to generate ideas about possible improvements in the new system. Brainstorming helped in collecting different viewpoints and innovative suggestions that could be implemented in the project.

Conclusion

By using these fact-finding techniques-interviews, questionnaires, observation, record analysis, and brainstorming-reliable and detailed information about the existing system was collected. This process helped to clearly identify the problems in the manual event management process and define the requirements for the proposed computerized Event Management System. As a result, the system design will be more accurate, user-friendly, and capable of solving real-world problems faced by customers and event managers.

5. Drawbacks of Existing System

The existing event management process is largely manual, where customers contact event managers or individual service providers to arrange programs such as birthdays, weddings, or corporate events. Although this traditional method is functional, it has several drawbacks that create difficulties for both customers and event organizers. Some of the major drawbacks are described below:

1) Time-Consuming Process

In the manual system, customers must personally visit or contact multiple service providers such as caterers, decorators, photographers, and musicians. Each booking requires separate communication, negotiation, and confirmation. This makes the process slow and inconvenient, especially when customers are busy or organizing large events.

2) Data Management Problems

Event managers often maintain records of customers, services, payments, and staff allocation in physical registers, notebooks, or spreadsheets. Over time, these records become difficult to organize, search, and update. There is also a risk of losing or misplacing important information. Retrieving old data for reference or report generation becomes very challenging.

3) Miscommunication and Errors

Since most communication is done through phone calls or verbal discussions, there is a high chance of miscommunication. Incorrect event dates, wrong service bookings, or incomplete requirements may occur due to human error. These mistakes directly affect customer satisfaction and derange the reputation of the event management service.

4) Inefficient Payment Tracking

In the manual system, payments are usually recorded in registers or on paper receipts. Tracking pending payments, calculating balances, or maintaining accounts for multiple events

becomes confusing and error-prone. This may lead to financial losses, disputes with customers, and lack of proper financial reports.

5) Difficulty in Staff Management

Assigning staff to different events is another major challenge in the existing system. If multiple events are scheduled close together, staff allocation may clash. Without a proper database, it is difficult to check staff availability, avoid double-booking, or track assigned tasks. This often leads to mismanagement during events.

6) Lack of Transparency for Customers

Customers do not have clear visibility of the services, costs, or booking status in the manual process. They need to depend entirely on the event manager for updates. This lack of transparency reduces trust and may result in dissatisfaction if expectations are not met.

7) Limited Reporting and Analysis

The manual system does not support report generation or analysis of past events. Event managers cannot easily review past bookings, analyze expenses, track staff performance, or evaluate customer preferences. This limits their ability to improve services or make informed business decisions.

Conclusion

The drawbacks of the existing manual event management system highlight the need for a computerized solution. Problems such as time delays Data mismanagement, financial errors, poor staff allocation, and lack of customer transparency can be eliminated by developing an automated Event Management System. The proposed system will store all information in a centralized database, ensure accuracy, provide quick access to data, and improve overall efficiency in event organization.

6. Scope Of the Proposed System

The proposed Event Management System aims to provide a computerized and centralized solution for organizing and managing events such as birthdays, weddings, anniversaries, and corporate functions. The system is designed to overcome the limitations of the existing manual process by integrating all the key functions of event planning into a single platform. The scope of this system extends to customers, event managers, service providers, and staff members, making it beneficial for all stakeholders involved in the event management process.

1) Customer Scope

For customers, the system provides an easy and convenient way to book events. They can choose the type of event, select services such as catering, decoration, photography, and music, and confirm bookings without needing to contact each service provider individually.

Customers can also view their payment status, pending balances, and booking details at any time. This enhances transparency, reduces confusion, and improves customer satisfaction.

2) Event Manager Scope

Event managers can use the system to maintain detailed records of customers, events, staff, and payments in a structured database. The system will allow managers to check service availability, assign staff according to event schedules, and track payment transactions.

Managers can also generate reports to analyze performance, identify customer preferences, and plan resources more effectively.

3) Service Provider Scope

The system provides scope for service providers such as decorators, caterers, and photographers by allowing their services to be linked with events in a systematic way.

Managers can check availability, allocate services, and calculate costs accurately. This ensures that services are delivered on time and without conflicts.

4) Staff Management Scope

The proposed system helps in efficient staff allocation by maintaining staff records, roles, and availability schedules. Managers can assign staff to specific events and tasks, reducing conflicts or double bookings. Staff members will have clear instructions regarding their roles and responsibilities for each event.

5) Financial Scope

The system simplifies payment tracking by recording all transactions digitally. It allows event managers to monitor pending and completed payments, generate receipts, and avoid financial errors. This increases reliability and provides customers with a clear understanding of their financial commitments.

6) Reporting and Analysis Scope

The proposed system will also provide reporting features. Event managers can generate reports related to event bookings, services used, payments collected, and staff assignments. These reports help in business analysis, decision-making, and future planning, ensuring continuous improvement in event management services.

7) Future Scope

The system has the potential to expand further with additional features such as online booking through mobile applications, integration of digital payment gateways, customer feedback modules, and real-time notifications. In the future, it can be upgraded to include advanced analytics, AI-based recommendations for services, and online marketing features for business growth.

Conclusion

The scope of the proposed Event Management System covers all major aspects of event organization, including customer bookings, service management, staff allocation, payment

tracking, and reporting. By centralizing these processes, the system will save time, reduce errors, improve coordination, and enhance customer experience. The flexibility and potential for future expansion make it a powerful tool for both small-scale and large-scale event management businesses.

7. Feasibility Study

Before developing any software system, it is necessary to determine whether the proposed solution is practical, achievable, and beneficial. This process is called a **feasibility study**. It helps in understanding the strengths, limitations, and overall viability of the new system before investing time and resources into its development.

For the **Event Management System (Birthday, Wedding, etc.)**, a feasibility study was conducted to analyze whether the system can effectively replace the existing manual process and provide long-term advantages. The study covers different aspects of feasibility, which are described below:

1) Technical Feasibility

Technical feasibility examines whether the proposed system can be developed and implemented with the available technology.

- The Event Management System requires a relational database (such as MySQL, Oracle, or MS SQL) to store and manage data efficiently.
- Front-end tools such as Java, .NET, or web-based technologies (HTML, CSS, PHP, etc.) can be used to design the interface.
- The system can run on standard desktop computers or laptops with basic hardware requirements (4GB+ RAM, 500GB storage, i3 processor or above).
- Since all required technology is easily available and cost-effective, the project is technically feasible.

2) Economic Feasibility

Economic feasibility determines whether the proposed system is financially viable.

- The cost of development includes hardware, software, and manpower (students and developers). Since open-source tools and existing college resources can be used, the cost of implementation is minimal.
- The benefits of the system, such as reduced errors, faster processing, better customer satisfaction, and reliable payment tracking, outweigh the costs.
- In a real-world business, the system would reduce dependency on manual work and help event managers save money and time. Therefore, it is economically feasible.

3) Operational Feasibility

Operational feasibility ensures that the system will be accepted and used effectively by the people involved.

- The proposed Event Management System is user-friendly and does not require advanced technical knowledge.
- Customers can easily book events and check details, while event managers can manage staff, services, and payments with simple operations.
- Since the system reduces workload, minimizes errors, and provides quick access to data, it will be well-accepted by both customers and event managers.

4) Schedule Feasibility

Schedule feasibility studies whether the system can be developed within the given time frame

- The Event Management System is of medium complexity and can be developed in stages: requirement analysis, design, coding, testing, and implementation.
- With proper planning and teamwork, the system can be completed within the academic project duration.
- Thus, it is feasible to finish the system within the given deadlines.

5) Legal and Social Feasibility

- The system does not violate any laws or regulations as it only manages booking and service records.
- It also has positive social feasibility since it improves communication, transparency, and customer satisfaction.

Conclusion

The feasibility study of the proposed Event Management System shows that the project is technically, economically, operationally, and socially feasible. It can be developed with the available resources, within the given time, and will provide long-term benefits to customers, event managers, and service providers. Therefore, the system is practical, achievable, and worth implementing.

ASSIGNMENT NO - 2

❖ Requirement Specification

1. Data Requirements of the System

Every information system relies on data as its most essential component. In an **Event Management System**, the effectiveness of the software depends on how accurately data is stored, organized, and retrieved. Since event management involves different stakeholders such as customers, event managers, service providers, staff, and finance departments, the system must handle diverse categories of data.

The proposed system requires a well-structured database that can manage information about customers, events, services, staff, and payments in an integrated manner. The following describes the major data requirements of the system:

1) Customer Data

The system must maintain detailed records of customers who book events. This includes:

- Customer ID (unique identifier)
- Customer Name
- Contact Number
- Email Address
- Residential Address

This information will be used to identify customers, send updates, and link them to their booked events.

2) Event Data

Each event is the central element of the system. For proper event planning and execution, the system should capture:

- Event ID (unique identifier)
- Event Type (Birthday, Wedding, Corporate, Anniversary, etc.)
- Event Date and Time
- Event Venue/Location
- Customer ID (to link event with the customer)

This data ensures that every event is uniquely stored and linked to its customer and related services.

3) Service Data

The system must manage different services required for events. These include:

- Service ID (unique identifier)
- Service Name (Catering, Decoration, Music, Photography, Lighting, etc.)
- Service Cost
- Availability/Status

This data allows customers and managers to select and allocate services according to event needs.

4) Event-Service Data (Mapping Data)

Since a single event may require multiple services, a mapping table is needed to store:

- Event ID
- Service ID
- Quantity (for catering, number of decorations, etc.)
- Total Cost

This ensures flexibility and accurate billing for multiple services linked to one event.

5) Staff Data

Efficient staff management requires proper records such as:

- Staff ID (unique identifier)
- Staff Name
- Role/Designation (Manager, Decorator, Caterer, Photographer, etc.)
- Contact Details
- Availability Schedule

This data helps in assigning the right staff to the right event and avoiding conflicts in staff allocation.

6) Event-Staff Data (Mapping Data)

Since multiple staff members may work on a single event, the system should maintain:

- Event ID
- Staff ID
- Assigned Task/Role

This ensures clear distribution of responsibilities and proper monitoring of staff performance.

7) Payment Data

Financial transactions form a critical part of the system. Payment data should include:

- Payment ID (unique identifier)
- Event ID
- Payment Date
- Amount Paid
- Balance Amount (if any)
- Payment Mode (Cash, Card, UPI, etc.)
- Payment Status (Pending, Partial, Completed)

This data provides clarity for both customers and event managers and reduces financial disputes.

8) Report Data

The system should also generate reports by using stored data. This includes:

- Daily/Monthly Event Reports
- Customer-wise Event Reports
- Service Usage Reports
- Staff Allocation Reports
- Payment/Revenue Reports

Such reports help in decision-making, resource management, and business growth analysis.

Conclusion

The data requirements of the Event Management System cover all important aspects of event planning and execution. The system must manage customer information, event details, services, staff, and financial transactions in an integrated database. By ensuring accurate, consistent, and organized data storage, the system will provide reliable outputs such as booking confirmations, payment receipts, and management reports. Thus, well-defined data requirements form the foundation of the proposed Event Management System.

2. Identify End Users of the System

The success of any software project depends largely on its usability and acceptance by its intended users. An Event Management System involves multiple stakeholders, each with different roles, responsibilities, and expectations from the system. Identifying these end users is important to design a user-friendly and effective solution. The proposed system will serve a wide range of end users as described below:

1) Customers (Clients)

Customers are the primary users of the system, as they book events such as birthdays, weddings, anniversaries, and corporate programs. Their requirements mainly include:

- Registering and creating their profiles in the system.
- Booking events by selecting the type, date, and location.
- Choosing specific services such as catering, decoration, music, or photography.
- Viewing and tracking payment details (advance, balance, pending).
- Receiving confirmation and updates regarding their events.

By using the system, customers can avoid the hassle of contacting multiple service providers individually. The system offers them transparency, convenience, and reliability.

2) Event Managers / Administrators

Event managers or administrators are responsible for handling the overall functioning of the system. They use the system to:

- Manage customer registrations and event bookings.
- Assign services and resources to different events.
- Allocate staff to events and monitor their responsibilities.
- Track payment records, generate bills, and maintain financial accounts.
- Generate reports for business analysis, staff performance, and service utilization.

For event managers, the system acts as a central tool to reduce manual work, improve efficiency, and ensure smooth execution of events.

3) Service Providers

Service providers such as caterers, decorators, photographers, and musicians also form an important category of end users. They interact with the system indirectly through event managers. Their requirements include:

- Receiving clear information about service bookings (date, time, and venue).
- Confirming availability and ensuring timely delivery of services.
- Coordinating with event managers regarding costs and resource requirements.

By having their services linked with events digitally, service providers face fewer miscommunications and scheduling errors.

4) Staff Members

Staff members play a key role in managing events successfully. They include supervisors, assistants, waiters, decorators, and technical staff. Their interaction with the system includes:

- Being assigned to specific events and tasks by the event manager.
- Receiving clear instructions about their roles and responsibilities.
- Checking schedules to avoid conflicts or double booking.
- Updating managers about task completion and progress.

With proper staff allocation through the system, workload is balanced, and event operations run more smoothly.

5) Financial/Accounts Users

Some event management organizations may have a dedicated accounts or finance team. Their responsibilities include:

- Recording all payment transactions in the system.
- Monitoring pending and completed payments.

- Generating receipts and financial summaries.
- Preparing monthly or yearly revenue reports.

This ensures financial transparency and avoids losses or disputes.

Conclusion

The end users of the proposed Event Management System include customers, event managers, service providers, staff members, and financial/account teams. Each group of users has specific needs, and the system is designed to fulfill those needs in an efficient and user-friendly manner. By serving multiple categories of users, the system not only improves customer satisfaction but also enhances the overall efficiency and profitability of event management businesses.

3. Input Data to the System

The effectiveness of any computerized system largely depends on the accuracy and completeness of the data entered into it. In the case of an Event Management System, different categories of users provide essential data to ensure smooth event planning, execution, and record-keeping. The system accepts a variety of input data, ranging from customer details to financial transactions. Below is a detailed description of the input data required for the system:

1) Customer Information

When a client registers or books an event, the system collects customer-related data such as:

- Full Name of the customer.
- Contact details (phone number, email address, residential address).
- Identification details (optional, e.g., ID proof for official events).
- Preferences regarding communication (SMS, email, calls).

This input data ensures that the event manager can contact the client and maintain personalized service.

2) Event Details

The most crucial input data is related to the event itself. It includes:

- Type of event (Birthday, Wedding, Anniversary, Corporate Program, etc.).
- Event Date, Start Time, and End Time.
- Venue details (address, hall name, or outdoor location).
- Estimated number of guests.
- Special instructions or customer-specific requirements.

This data is important for scheduling, resource allocation, and avoiding event conflicts.

3) Service Requirements

Customers often require additional services, which must be recorded in the system. Examples include:

- Catering (menu selection, number of plates, food preferences).
- Decoration (themes, color schemes, stage setup).
- Photography & Videography (photographers required, style of coverage).
- Entertainment (DJ, music band, anchor, dancers)..
- Transportation (buses, cars for guests, bridal cars).

By inputting these details, managers can confirm availability and contact respective service providers

4) Staff Allocation Data

The system also requires input data related to staff members, such as:

- Staff name and designation.
- Availability dates.
- Assigned tasks (e.g., supervisor, waiter, decorator, technical support).
- Shift timings for large events.

This input helps avoid misallocation and ensures every task is assigned to the right person.

5) Financial Data

Managing payments is one of the key objectives of the system. Input data includes:

- Estimated budget for the event.
- Advance payment made by the customer.
- Pending balance and due dates.
- Mode of payment (cash, card, UPI, cheque, etc.).
- Service-wise costing (catering charges, decoration charges, staff charges).

This ensures accurate billing and minimizes financial risks.

6) Feedback and Remarks

After the event, customers may provide ratings, suggestions, or complaints. Input data for this includes:

- Customer feedback (satisfaction rating, written comments).
- Suggestions for improvement.
- Complaints, if any, regarding staff or services.

This information helps improve service quality and customer satisfaction for future events.

7) System Administration Data

Event managers or administrators also enter data for system setup and management:

- Login details and user credentials for different staff.
- Updates regarding service packages and pricing. Event cancellation or rescheduling details.
- Backup and record-keeping inputs.

This ensures smooth operation and security of the system.

Conclusion

The input data for the Event Management System includes customer details, event information, service requirements, staff allocation, financial transactions, feedback, and administrative records. Each piece of input data plays a vital role in ensuring that events are well-organized, services are properly scheduled, payments are tracked, and customers remain satisfied. The quality of this input data directly affects the success and reliability of the proposed system.

4. Output Information from the System

Every computerized system is designed to transform input data into meaningful output that helps users make decisions and carry out their tasks effectively. The Event Management System processes all customer details, event requirements, staff allocations, and financial records to generate accurate and organized output information. This output is valuable to customers, event managers, service providers, and staff members.

The key categories of output information from the system are as follows:

1) Customer-Oriented Output

For customers, the system provides:

- **Event Booking Confirmation:** A receipt or digital confirmation of the booked event with date, time, venue, and selected services.
- **Service Details:** Information about catering, decoration, photography, or entertainment booked for the event.
- **Payment Receipts:** Details of advance payment made, pending balance, and due dates.
- **Status Updates:** Notifications or messages regarding confirmed, rescheduled, or cancelled bookings.

This output builds customer trust and ensures transparency.

2) Event Manager / Administrator Output

For administrators or event managers, the system generates:

- **Event Schedules:** A calendar of upcoming events with complete details to avoid conflicts.
- **Resource Allocation Reports:** Information about which service providers and staff have been assigned to which events.
- **Task Sheets:** Detailed task assignments for staff with deadlines and responsibilities.

- **Financial Reports:** Event-wise revenue, pending payments, and profit/loss summaries.
- **Service Utilization Reports:** Data on how frequently different services (catering, photography, decoration) are booked, which helps in business planning.

This output helps managers improve coordination and monitor overall operations.

3) Service Provider Output

For caterers, decorators, photographers, and other service providers, the system provides:

- **Booking Notifications:** Date, time, and place of the event where their services are required.
- **Requirement Details:** Specific needs such as menu for catering, decoration themes, or photography styles.
- **Payment Information:** Charges agreed upon and payment status for their services.

This output reduces miscommunication and ensures timely delivery of services.

4) Staff Member Output

For staff members, the system generates:

- **Work Allocation Sheets:** Details of tasks assigned for specific events.
- **Shift Timings:** Schedules to prevent conflicts when multiple events are held on the same day.
- **Duty Confirmation:** Clear communication of roles (waiter, decorator, supervisor, assistant).

This ensures that the workload is properly distributed and every staff member knows their responsibilities.

5) Financial / Accounting Output

For finance users, the system produces:

- **Invoices and Bills:** Auto-generated invoices for customers.
- **Payment Reports:** Pending and completed payments by event or client.
- **Revenue Summaries:** Monthly or yearly reports for financial analysis

Such output ensures financial transparency and assists in decision-making for future business investments.

6) Analytical and Management Output

The system also provides higher-level output that helps in analysis and planning:

- **Performance Reports:** Success rate of events, customer satisfaction records, and staff efficiency.
- **Customer Database:** Records of past clients and their preferences for future reference.
- **Event Trends:** Data showing which types of events (weddings, birthdays, corporate programs) are most in demand.

This output helps the management identify growth opportunities and improve services.

Conclusion

The **output information of the Event Management System** includes booking confirmations, service details, staff schedules, financial records, invoices, and management reports. These outputs are designed to meet the needs of different end users such as customers, event managers, staff, service providers, and finance teams. By providing accurate, timely, and organized output, the system ensures smooth operations, customer satisfaction, and better decision-making for the organization.

5. System Requirements

For the development of any software, it is important to define **functional requirements, non-functional requirements, and processing requirements**. These requirements describe what the system should do, how it should behave, and how the data should be processed. A well-defined requirement set ensures that the proposed Event Management System is efficient, reliable, and user-friendly.

1) Functional Requirements

Functional requirements describe the specific features and operations that the Event Management System must perform. For this project, the main functional requirements include:

- **Customer Registration & Login:** Customers must be able to register, create profiles, and securely log in to the system.
- **Event Booking:** Customers should be able to book events (birthday, wedding, anniversary, corporate program, etc.) by providing event details
- **such as date, venue, and guest count. Service Selection:** Customers can select additional services such as catering, decoration, photography, entertainment, or transportation.
- **Staff Allocation:** The system must allow event managers to assign staff members for specific tasks and avoid scheduling conflicts.
- **Payment Management:** The system must record advance payments, pending balances, and generate invoices.
- **Reports Generation:** Managers should be able to generate reports on events, staff allocation, financial transactions, and service utilization.
- **Notifications/Reminders:** Customers and staff should receive notifications. about bookings, pending payments, or upcoming events.
- **Feedback Collection:** Customers must be able to provide feedback and ratings after an event.

2) Non-Functional Requirements

Non-functional requirements describe the quality, performance, and reliability aspects of the system. For the Event Management System, these include:

- **Usability:** The system should be simple and user-friendly, so even non-technical users can operate it easily.
- **Performance:** The system must respond quickly to user actions, even when handling multiple event bookings
- **Scalability:** The system should support growth, allowing management of more events, staff, and services as the business expands.
- **Reliability:** The system should ensure accurate and consistent handling of data without loss or corruption.
- **Security:** User authentication, role-based access control, and secure storage of financial details are essential.
- **Availability:** The system should be available with minimal downtime, especially during peak event seasons.
- **Portability:** The system should be accessible across devices such as desktops, laptops, or web browsers.
- **Maintainability:** Future upgrades, bug fixes, and modifications should be easy to implement.

3) Processing Requirements

Processing requirements specify how the system handles and processes data once it is entered. For the Event Management System:

- **Event Scheduling:** The system must check for date and venue availability before confirming an event booking.
- **Service Coordination:** Once services are selected, the system should automatically link them with the relevant service providers and update availability.

- **Staff Assignment:** The system should process staff availability data and prevent double-booking of the same employee.
 - **Financial Processing:** Payments entered into the system should be automatically reflected in customer accounts, invoices, and financial reports.
 - **Report Generation:** The system must process raw data (event records, payments, staff tasks) and convert it into meaningful reports for managers.
 - **Data Validation:** Input data such as dates, payments, and customer details should be validated to prevent errors.
 - **Backup & Recovery:** The system should process data backups automatically to ensure safety against accidental loss.
-

Conclusion

The **functional requirements** define what the Event Management System must do, such as customer booking, payment management, and staff allocation. The **non-functional requirements** define the quality aspects, including performance, usability, and security. The **processing requirements** explain how the system will handle input data to generate accurate output. Together, these requirements ensure that the proposed Event Management System will be efficient, reliable, and capable of handling the growing needs of event management businesses.

→ Identify all tables, fields, relationship between tables etc.

1. CLIENT TABLE :

Attribute Name	Date Type	Size	Key	Description
Client_ID	INT	5	Primary Key (PK)	Unique ID for each client
Client_Name	VARCHAR(50)	100		Full name of the client
Phone_No	VARCHAR(50)	15		Client contact number
Email	VARCHAR(50)	50		Client email address
Address	VARCHAR(50)	100		Client's home or office address

2. EVENT TABLE :

Attribute Name	Date Type	Size	Key	Description
Event_ID	INT	5	Primary Key (PK)	Unique ID for each client
Event_Name	VARCHAR(50)	100		Name of the event (e.g. Sakshi's Birthday)
Event_Type	VARCHAR(50)	100		Type of event (Birthday, wedding etc)
Event_Date	DATE	—		Date of the event
Venue	VARCHAR(50)	100		Place where the event will be held
Budget	DECIMAL	(10,2)		Total estimated budget
Client_ID	INT	5	Foreign key (FK)	Refers to Client_ID in CLIENT table

3. VENDOR / SERVICE PROVIDER TABLE :

Attribute Name	Date Type	Size	Key	Description
Vendor_ID	INT	5	Primary Key (PK)	Unique ID for each Vendor/Service
Vendor_Name	VARCHAR(50)	100		Name of the service provider
Service_Type	VARCHAR(50)	100		Type of the service (Catering Decoration, Music, etc)
Phone_No	VARCHAR(15)	15		Vendor contact number
Venue	VARCHAR(50)	100		Vendor email
Budget	DECIMAL	(10,2)		Cost charged by the Vendor

4. BOOKING TABLE

Attribute Name	Date Type	Size	Key	Description
Booking_ID	INT	5	Primary Key (PK)	Unique Booking ID
Event_ID	INT	5	Foreign Key (FK)	Refers to Event_ID in EVENT table
Client_ID	INT	5	Foreign Key (FK)	Refers to Client_ID in Client table
Vendor_ID	INT	5		Refers to Vendor_ID in VENDOR table
Booking_Date	DATE	—		Date when the booking was made

5. STAFF TABLE

Attribute Name	Date Type	Size	Key	Description
Staff_ID	INT	5	Primary Key (PK)	Unique ID for each staff member
Staff_Name	VARCHAR(50)	100		Name of the staff member
Role	VARCHAR(30)	50		Job role (Manager, Cleaner, Assistant, etc)
Phone_No	VARCHAR(10)	15		Contact Number
Salary	DECIMAL	(10,2)		Salary of the staff member

6. PAYMENT TABLE

Attribute Name	Date Type	Size	Key	Description
Payment_ID	INT	5	Primary Key (PK)	Unique Payment ID
Booking_ID	INT	5	Foreign Key (FK)	Refer to Booking_ID in Booking Table
Payment_Date	DATE	—		Date of payment
Amount	DECIMAL	(10,2)		Amount Paid
Payment_Mode	VARCHAR(10)	20		Mode of payment (Cash, UPI, Card, etc)
Status	VARCHAR(5)	10		Payment Status (Paid/Pending)

"Our wedding was beautifully organized and everything went perfectly as planned. Truly unforgettable experience."

Mr & Mrs Joshi

17 Apr 2026, 15:33

"The overall experience was excellent and very smooth. The website is easy to use and booking an event took very little time. I really liked the variety of services available in one place. The team was professional and handled everything perfectly. I would definitely recommend this platform to others."

Mr.John

* Customer Login Page *

→ Input Page

The screenshot shows a web browser window with a dark red header. The header contains the word "EVENTO" on the left, a navigation menu with links "Home", "Services", "Gallery", "Feedback", "Book Now", "Customer Login", and "Admin Login" in the center, and a white search bar on the right. The main content area is white and features a centered "Customer Login" form. The form has a title "Customer Login" in dark red. Below the title are two input fields: "Email Address" and "Password". The "Email Address" field is empty, and the "Password" field is also empty. Below the password field is a dark red "Login" button. At the bottom of the form, there is a link "New customer? [Sign up here](#)".

→ Output Page

The screenshot shows the same web browser window as the input state, but with the "Customer Login" form filled out. The "Email Address" field now contains the text "sakshikranshirke@gmail.com". The "Password" field is filled with a series of dots, and a small eye icon is visible on the right side of the field. The "Login" button remains dark red. The link "New customer? [Sign up here](#)" is still present at the bottom of the form.

THANK YOU

Event Management System Project

I would like to express my sincere gratitude to my project guide **Mr. Pratima Gund (Madam)**, for her valuable guidance and institution for their valuable support and guidance throughout the development of the Event Management System project.

This project helped me gain practical knowledge of **PHP, MySQL, Bootstrap, XAMPP, database management, and web application development**. The experience enhanced my technical skills and understanding of real-world software development processes.

I am also thankful to everyone who contributed directly or indirectly to the successful completion of this project.

Thank You.
